

## DEW Police Investigation & Crime Analysis Report

**Date:** May 17, 2026

**Crime Analyst:** Ms. Mechael Wright-Hodges

**Topic:** Catfish Terrorism

**Division:** DEW Police / Direct Energy Weapons Agency, Inc.

### Analyst Note

This analysis is made **without medical, forensic, or technical testing of the accused** for exposure to, access to, or use of directed-energy, acoustic, sonic, ultrasonic, electromagnetic, ionizing radiation, or mind-control-related weapons technology. This report is based on civilian complaints, reported patterns, victim statements, and crime-analysis observations related to suspected directed-energy and remote harassment complaints.

### Summary

Within the space of suspected Directed Energy Weapons Technology, civilians have reported experiences involving weapons, acoustic devices, sound-effects technology, directional energy, sonic and ultrasonic devices, painful vibrations, electroshock-like sensations, and other remote methods of harassment or assault.

A repeated pattern reported by victims is what this analysis identifies as **“Catfish Terrorism.”** In this context, catfishing is not limited to online deception. It refers to the alleged use of deception, impersonation, sound manipulation, psychological misdirection, and false targeting cues to confuse victims about who is responsible for the attacks.

Victims often report being led to believe the source is a neighbor, family member, employer, co-worker, police officer, government agency, or another visible person in their life. This confusion may isolate the victim, damage relationships, and prevent the victim from identifying the true source of the alleged attacks.

### Core Concern

When this technology is allegedly used to harass, assault, torture, or even contribute to the death of a man, woman, or child, it may not leave obvious physical evidence showing that directed energy, sound, or remote technology caused the injury. Someone would have to be actively looking for traces of energy exposure, environmental manipulation, acoustic activity, or related technological interference in and around the victim’s body, home, sleeping area, or living environment.

This makes the crime difficult to prove under traditional investigative methods. It also allows alleged offenders, accomplices, gang members, extremists, or organized actors to remain hidden while victims are left appearing confused, fearful, isolated, or mentally distressed.

### **Catfish Terrorism Pattern**

Catfish Terrorism allows alleged attackers to occupy a victim's life for months or years by creating confusion about the true source of the attacks. Victims report being psychologically manipulated into believing:

- It is the neighbor.
- It is a family member.
- It is an employer or co-worker.
- It is local police.
- It is the CIA, FBI, or another government agency.
- It is someone above, below, or beside their apartment.
- It is someone nearby when the actual source may be elsewhere.

This tactic can isolate the victim and create distrust toward everyone around them. Victims may be psychologically "imprisoned" by repeated voice harassment, sound effects, painful sensations, or remote manipulation that convinces them they cannot trust anyone.

### **Use of Sound-Effects Technology**

Another reported form of Catfish Terrorism involves sound-effects technology used to trick victims into believing attackers are located somewhere they are not.

For example, in one reported case, a victim stated they heard footsteps in the apartment above them. Later, they reportedly found out the unit was empty. This type of experience suggests the possible use of remote sound placement, building-based sound projection, vibration technology, or other methods designed to mislead the victim.

Victims have reported that these systems appear to be built into or directed through homes, apartments, businesses, hotels, or other structures. Reports include:

- Remotely played sounds.
- Footsteps or movement noises.
- Human voices.

- Painful vibrations directed at the head or body.
- Electroshock-like sensations.
- Pressure to the head or body.
- Attacks during sleep.
- Overnight harassment from above, below, or nearby areas.

### **Voice Impersonation and Psychological Misdirection**

For victims who report hearing external human voices, Catfish Terrorism may involve the use of many different voice sounds or impersonations. Victims have reported voices that sound like:

- White or Caucasian police officers.
- Black men.
- Women.
- Family members.
- Neighbors.
- Authority figures.
- People known to the victim.

The purpose of this alleged tactic appears to be confusion, distraction, fear, isolation, and loss of productivity. Some victims report that these voices interfere with sleep, work, family relationships, faith, business development, and the ability to make progress in daily life.

### **Remote Manipulation and Criminal Acts**

A major concern in this analysis is the possibility that some victims may be remotely influenced, psychologically pressured, or manipulated into actions they would not normally commit.

When the public hears about a person with no criminal history committing a violent or shocking act, the public often focuses only on the act itself. In this space, DEW Police asks a deeper investigative question:

**Who, if anyone, was talking to, pressuring, manipulating, or remotely influencing the accused before the act occurred?**

The underlying factor that continues to be ignored is the possibility of **remote-control influence, voice-based manipulation, psychological conditioning, or technological interference.**

This report does not claim every case involves this technology. However, it identifies this as an investigative question that should not be automatically dismissed when unusual neurological, behavioral, sensory, or voice-related complaints are present.

### **Surveillance Technology and Abuse**

There may have been a time when advanced surveillance or directed technologies were used for national security, military, or intelligence purposes. However, a concern raised in this analysis is that, over time, hate, greed, envy, personal revenge, criminal networks, or unauthorized actors may have gained access to harmful methods of use.

When technology can affect the body, mind, sleep, emotions, or behavior without visible contact, no private individual, criminal group, gang member, or unauthorized actor should be trusted with that power.

In this analysis, Catfish Terrorism is described as a cowardly method of hiding in plain sight while spreading false rumors, recruiting accomplices, and isolating the victim.

### **Accomplice Confusion**

Another concern is that accomplices may not always know the true identity of the leader or organizer. They may be following false information, rumors, hatred, or manipulated instructions without verifying facts.

However, lack of knowledge of the true leader does not remove responsibility. Individuals who participate in harassment, stalking, rumor-spreading, intimidation, surveillance, or isolation of a victim remain responsible for their own actions.

The victim does not get back the time lost, the sleep lost, the family time lost, the health lost, or the years stolen by the abuse.

### **Bedroom Targeting and Sleep Deprivation**

A repeated pattern in victim reports is overnight targeting, especially in bedrooms.

Homes, apartments, and hotels often have layouts, architectural designs, floor plans, or room structures that can show where bedrooms are located. This raises concern that alleged attackers may know in advance where a victim is likely to sleep and where the victim's head and body will be positioned.

Many victims who have filed reports with DEW Police have stated they are sleep deprived as a result of being psychologically and/or physically tortured in their bedroom.

Reported overnight symptoms and experiences include:

- Sleep disruption.
- Pressure to the head.
- Painful vibrations.
- Voice harassment.
- Sudden waking.
- Fear of lying down.
- Sensations from above or below the bed.
- Feeling attacked through walls, ceilings, floors, or nearby units.

Sleep deprivation is a serious concern because it can affect memory, emotional stability, physical health, decision-making, and a victim's ability to seek help.

### **Investigative Needs**

Investigating these cases requires specialized tools and protocols beyond traditional police response.

At minimum, investigators responding to suspected Directed Energy Weapons complaints should have access to:

- 1. See-through-wall detection technology**

To help identify hidden devices, unusual activity, or suspicious placement of equipment in walls, ceilings, floors, nearby units, or adjoining spaces.

- 2. Energy detection equipment**

To detect unusual energy emissions, radiofrequency activity, electromagnetic exposure, acoustic signatures, ultrasonic activity, or other environmental anomalies.

These tools should be available in investigator vehicles when victims of suspected DEW-related attacks call for help. Based on reported patterns, the technology or source of impact is often believed to be set up or directed toward the area where the victim sleeps.

### **Analyst Personal Statement**

I not only conduct this work for victims of suspected Directed Energy Weapons attacks, I also do this work for myself.

I continue to report being psychologically and physically tortured in my home, especially overnight, from above and below my apartment. I have reported these concerns to national security agencies, including the FBI, and did not receive a response that resolved the matter.

That lack of response helped lead me to form **Directed Energy Weapons Agency, Inc., DEW Police, and Havana Syndrome-related civilian advocacy efforts** to create a documentation pathway for civilians who report similar experiences.

### **Preliminary Conclusion**

Catfish Terrorism, as identified in this analysis, is a suspected method of deception used to confuse victims, isolate them, misdirect suspicion, and prevent accountability in cases involving reported directed-energy, acoustic, sonic, ultrasonic, remote harassment, or psychological manipulation technologies.

The key concern is not only the reported attack itself, but the strategy of hiding the source, impersonating others, using sound and voice deception, and forcing victims into confusion, fear, isolation, and sleep deprivation.

DEW Police recommends continued documentation, victim interviews, pattern analysis, and development of investigative protocols that include energy detection, acoustic analysis, environmental review, and inspection of sleeping areas where victims report repeated attacks.

**The central investigative question remains:**

**Who is truly behind the attack, and what technology, method, or network is being used to hide the source?**
